1. (Amended) A system executed by a computer that recommends a consumer product selection across a network to a consumer, said system comprising:  
  
a recommendation engine comprising a first computing module, embodied in the computer, that determines a difference between a plurality of consumer products having a plurality of descriptors by differentiating between at least one descriptor of each said plurality of consumer products and providing said difference to a second computing module embodied in the computer;  
  
a descriptor module, embodied in the computer, that is configured to receive human descriptor trait (HDT)\_descriptor input regarding the plurality of descriptors of at least a sampled consumer product from at least two independent consumers at two independent nodes, respectively, on the network;

the second computing module, coupled to said recommendation engine, that sorts between each of said consumer products to form at least two classes for said plurality of consumer products;

a third computing module, embodied in the computer, and coupled to said recommendation engine, that determines for each of said plurality of consumer products a correlation between said at least two classes and each of said plurality of descriptors including the received HDT descriptor input, said third computing module assigning a weighting term for each of said plurality of descriptors based upon each of said descriptor's ability to sort between said at least two classes; and

a fourth computing module, embodied in the computer, and coupled to said recommendation engine, that cooperatively operates on said weighting terms to provide a recommendation.

3. Authorization for this examiner's amendment was given in a telephone interview with Mr. Philip J. Articola (Reg. No. 38,819) on May 11, 2009.
